3. The following is a statement of reasons for the indication of allowable subject matter: none of the prior art discloses or suggests a signal processing apparatus comprising: a processing device configured to iteratively decode each of the plurality of symbols contained in the composite signal, wherein the composite signal is represented, at least in a part, by a channel gain matrix, wherein the processing device is further configured perform a decomposition of the channel gain matrix into an orthogonal matrix Q and a triangular matrix R , and wherein the plurality of symbols are decoded within a constrained enumeration formalism of the triangular matrix R ; enumerating to determine probabilities of a given symbol being transmitted from a given transmission element of the plurality of transmission elements using a constrained data sub-set of the triangular R matrix; and making a hard decision about which is the most probable symbol to have been transmitted from the given transmission element so as to reduce a number of enumerations required to carry out a further probability calculation.
